PERSONAL PROFILE WEBSITE

HTML Lab Project Report

Course activity: Six-page personal website using HTML5

Date: October 2026

1. Project Overview

This project is a personal profile website organized into six linked HTML pages. It introduces the student, presents educational background and skills, showcases projects, shares media interests, and provides a contact form.

2. Objectives

Create a clear personal homepage; connect six pages through a consistent navigation menu; practise semantic HTML elements, lists, tables, links, images, multimedia, and forms; and organize project resources in folders.

3. Technologies Used

HTML5 is used to structure the website. The lab exercise specifies HTML only; CSS and JavaScript are not required.

4. Website Pages

Home (index.html): welcome message, profile picture, navigation, and introduction.
About (about.html): biography, interests, quotations, abbreviations, and dates.
Skills (skills.html): education and skills tables, progress and meter elements, definitions, and expandable details.
Projects (projects.html): project images, captions, nested lists, achievements, and a downloadable report.
Media (media.html): audio, video, an embedded YouTube video, and external links.
Contact (contact.html): labeled form inputs, fieldsets, dropdowns, text area, and browser validation.

5. Folder Organization

Keep all six HTML files together. Place pictures in images/, audio and video in media/, and this report in documents/project-report.pdf. Relative paths in HTML should match the actual filenames.

6. Download Link

The Projects page can link to this report with: `<a href="documents/project-report.pdf" download>Download My Project Report (PDF)</a>`.

7. Testing Checklist

Open index.html in a browser. Verify that all six navigation links work; images and multimedia load; the downloadable PDF link opens or downloads; and required form fields trigger browser validation.

8. Conclusion

The website provides practical experience with HTML page structure, navigation, accessible content, multimedia, and forms. It can be expanded later with CSS and JavaScript.
